Multitong press fittings 16x2 20x2 26x3 32x3 40x3,5 50x4 63x4,5 75x5 90x7

RM press fittings are ideal for use in hot and cold water distribution, domestic water or heating/cooling systems.

The wide range of profiles and sizes supported by traditional system components enables to solve with PEX, Pb or multilayer pipes every problem experienced on site set for space limits and technical/economic choices in traditional or manifold-based distributions.

Main characteristics: - enhanced sealing performance with a new fitting profile;

- optional pressing with a wide range of tongs (multitong pressing).

Special attention has been given to planning and production of the fittings to provide utmost reliability to the components and make the installer's work much easier and safer.

Their main peculiarities are the stainless steel flared bush for easier insertion of the pipe, the bush ring for visual verification of full insertion of the pipe (essential condition for firm pressing), the insulating separator for multilayer pipe joints (the aluminum film may corrode the connection fittings for electrochemical reactions).

The fittings are provided fully assembled and the required pipe size is clearly stamped on the bush.

In chased installations, keep the cement mixture away from the fitting metal parts.

We recommend an inspectionable joint, for example using a flush-mount plastic box or a box insulated from the structure and able to dilate, so as to prevent chemical reactions on the metal surfaces and stresses by thermal dilation.

Installation

We recommend complying with the instructions below to prevent damage to the hydraulic sealing elements during installation and obtain an efficient joint.

Cut the pipe 90° to its axis with a cutter (we recommend turning the cutter slightly during this operation) or a roller pipe cutter to prevent ovalizations.

State-of-the-art seal of mechanic press fittings can be obtained only when the pipe and fitting feature corresponding nominal diameter and thickness.

We recommend verifying the component dimensions before pressing to prevent improper assemblies.

Burr and calibrate the pipe internal surface with the special tool (making sure the cutter and pipe have the same size).

Lubricate the pipe internal surface with lubricants suitable for the system materials and use.

Insert the pipe all the way inside the fitting; the correct coupling position of the pipe can be checked visually through the bush ring slots. The bush flared profile makes the insertion easier.

To press the fittings, use a jaw of the same size of the fitting and profile complying with table "Tongs profiles" on page 2:

- · open the tongs and make sure there are no debris inside before inserting the fitting;
- insert the fitting in the tongs grooves matching the profiles.
- start pressing and wait for full clamping to block the fitting.

Stay away from the moving mechanisms during this operation to prevent undesired accidents.

Verify proper fitting by looking at the bush ring to verify the correct position of the pipe. This is a one-time operation, in case of improper pressing the pipe must be cut and a new fitting is required to create the joint.

For proper long-lasting operation of the press, plan periodical revisions and keep the tongs clean and lubricated at all times to prevent anomalous stresses during pressing that may affect the mechanism duration.

NOTE. In chased fitting installations, keep the cement mixture away from the component metal parts.

We recommend an inspectionable joint, for example using a flush-mount plastic box or a box insulated from the structure and able to dilate so as to prevent chemical reactions on the metal surface and stresses by thermal dilation.
